

Task Flow Document

Manage Data

Description:

Allows authorized personnel to create, read, update, and delete all core scheduling parameters such as faculty, subjects, classrooms, and constraints before generating a timetable.

Primary Roles:

- Authorized Personnel

Secondary Roles:

- Faculty Member
- Technical Support

Task Flow Steps:

1. Access the Platform

The user opens a web browser and navigates to the IntelliSchedule platform's login page. They enter their assigned credentials (username and password) to authenticate and gain secure access to the system.

2. Navigate to Data Module

After successfully logging in, the user is presented with the main dashboard. From the navigation menu, they select the 'Data Management' or 'Scheduling Parameters' section to access the tools for managing core data.

3. Select Data Category

Within the data management section, the user chooses the specific category of data they wish to work with. Options typically include 'Faculty', 'Classrooms', 'Subjects', and 'Batches'.

4. Add New Data Entry

The user decides to add a new item, such as a new faculty member or classroom. They click the 'Add New' button, which opens a form where they input all the required details (e.g., faculty name, room capacity, subject code).

5. Update Existing Data

The user selects an existing entry from a list to modify it. They can update information like a faculty member's availability, a classroom's features, or a subject's prerequisites.

6. Define Scheduling Constraints

The user navigates to a dedicated subsection to define or update global and specific rules. This includes setting constraints such as maximum weekly teaching hours for faculty, mandatory fixed slots for certain classes, or rules preventing back-to-back labs.

7. Save and Validate

After adding or editing any information, the user clicks 'Save'. The system automatically validates the inputs to ensure they are complete

and logical, preventing errors like assigning a faculty member to two subjects at the same time.

8. Exit Data Management

Once all necessary data has been accurately entered and updated, the user can navigate away from the data management module to perform other tasks, such as initiating timetable generation.
